AI Design Visualization Suite

Revised Detailed Quotation

Mayank Rohilla — Founder, BoardAlgo
8708056843 | mayankrohilla@boardalgo.in | mayankrohilla729@gmail.com

Prepared for	Terucon India Private Limited
Date	17 September 2026
Reference	TIPL-PROP-02 (Rev. 2)
Supersedes	TIPL-PROP-02 dated 1 September 2026

Scope We Understood

This quotation covers a client-facing AI design visualization suite, built around a shared AI engine, now extended with a marketplace, structured BOQ generation, dual quotation tracking, elevation (exterior) design support, brand-priority controls, a labour training program, and post-launch support. It lets clients see a photorealistic transformation of their space, collaborate with co-decision-makers, bring in outside inspiration, get instant material identification and pricing, purchase materials directly, and move from an initial estimate to a measurement-verified final bill — all without a separate technology stack for each capability.

Features Covered — Core Suite

Feature	What it does
AI dream render + hover editing	Upload a site photo, choose materials, and see the space transformed instantly. Hover over any surface to see its price and swap just that one material.
Collaborative decision mode	Multiple stakeholders each select their preferred materials; the AI recommends options that score well against everyone's picks, so group decisions move faster.
Inspiration import	Clients bring in a Pinterest board or upload their own inspiration photos, and the AI matches them to real materials from your catalogue.
Point-and-identify material	Point the camera at any material, anywhere, and instantly find its closest match in your catalogue with live pricing.
Voice/text brief parser	Clients describe their vision in plain language and the app pre-fills a matching design automatically, cutting down manual selection.
Ask-your-quote assistant	A chat assistant that answers client questions about their own quotation, grounded strictly in their actual BOQ numbers.
Colour-match from any photo	Upload a photo of anything and get matching wall colours pulled from your paint partner's palette.
WhatsApp quote delivery & approval	Quotations are sent and approved directly over WhatsApp instead of email.
Human-like client chat & voice assistant	A real-time bot that talks with your clients like a real person would, including taking incoming calls directly — answering questions instantly and cutting down the manual back-and-forth your team currently handles.

Additional Features Requested by Terucon

You also asked us to add the following capabilities:

Feature	What it does
Materials Marketplace	Clients can browse and buy materials directly from their renders and BOQ, with orders tracked in the admin panel.
Structured Bill of Quantities (BOQ)	Every estimate breaks into item, unit, quantity, rate, and amount — not a single lump sum.
Actual vs. Virtual Quotation	Tracks the AI estimate against the final, measurement-verified bill, so any difference is visible to admin and client.
Elevation (Exterior Design) Support	Same hover-editing and material-swap experience, extended to building exteriors and facades.
Brand Priority Controls	Admin can set which brands appear first in the BOQ and marketplace, without changing pricing.
Labour Training Program	Extra pages so labour can register and access training content whenever needed.
Hover Editing & Rendering — Core Priority	The hover-based material swap and rendering engine stays the first build priority.
Milestone-Based Payment Flow	Customers pay 50% upfront; the final bill adjusts once real measurements are taken.
Post-Launch Support	6 months of bug fixes and reasonable support for new feature requests after go-live.
Session Recording & Analytics (PostHog)	PostHog integration gives your admin team session recordings and usage analytics.
Product/Installation Guide	Each material includes usage, installation method, adhesives, accessories, and technical specs.

Complete Feature Set — Summary

With the additions above, the full scope of this engagement now covers:

- All nine original features (AI render + hover editing, collaboration mode, inspiration import, point-and-identify, voice/text brief parser, ask-your-quote assistant, colour-match, WhatsApp delivery, human-like chat/voice assistant)
- Materials marketplace with direct purchase and order tracking
- Structured BOQ generation (task, unit, quantity, rate, amount)
- Actual vs. virtual quotation tracking
- Elevation (exterior) rendering support, alongside interior renders
- Admin-controlled brand priority/sequencing in BOQ and marketplace
- Labour training program
- Milestone-based payment flow with measurement-based bill adjustment
- 6 months of post-launch support

- PostHog session recording and analytics integration
- Product/installation guide per material — usage, installation method, adhesives, accessories, and technical specs

Our Recommended Approach — AI-Assisted, Supervisor-Validated

- The rendering engine requires model fine-tuning against your actual catalogue so materials shown (interior and now exterior/elevation) match what gets installed, not a generic approximation.
- Every AI-generated estimate, BOQ line item, and render is designed to route through your existing Admin/Supervisor review step before reaching a client.
- The chat assistant is restricted to each project's own quotation data, so it never guesses at a number it hasn't been given.
- The actual-vs-virtual quotation logic keeps a full audit trail, so any adjustment after measurement is transparent to both your team and the client.
- Frontend will be modern and professionally designed; exact visual direction to be finalized together before build begins.

Scope Clarity

To set the right expectations: we are not building a full enterprise ERP system as part of this engagement — that's a significantly larger undertaking on its own. What we are building is a focused, working admin panel that covers exactly what you need day to day:

- Upload and manage your designs (interior and elevation)
- Edit pricing and BOQ rates
- View incoming marketplace orders
- Control brand display sequencing
- Track virtual vs. actual quotations per project

Simple, functional, and ready to use — without the overhead of a full ERP build.

Talk To Your System Like You'd Talk To a Person

We'll build this with MCP (Model Context Protocol) — the connection technology that's rapidly becoming the standard for linking real business systems to AI assistants across the industry. In practice, this means you'll be able to connect your admin panel directly to Claude AI and simply ask it to do anything on your platform, or see anything on it — check orders, update a price, pull up a design, review a BOQ — the same way you'd ask a person sitting next to you.

No new software to learn. No training your team on another dashboard. If you can say it in a sentence, the system understands it.

What's Included

- Domain name registration and setup
- CRM integration, provided your CRM supports standard API access — as of now Vyapar
- $50 in Render hosting credit (one-time), covered by us — comfortably covers hosting for about 4–5 months
- PostHog analytics/session-recording integration

What's Not Included

Third-party API and usage costs — LLM/AI model usage, image generation, vision/segmentation calls, WhatsApp Business API messaging, voice/calling costs for the AI phone assistant, payment gateway fees for marketplace transactions, and similar per-use charges from underlying providers — are billed separately at actual cost, entirely apart from the hosting credit above, and are not part of this investment figure.

Total Cost

AI Design Visualization Suite — full scope (all features above)	**Rs. 2,00,000**

A meaningful part of this investment goes into fine-tuning the AI models against your actual product catalogue — including both interior materials and exterior/elevation finishes — this is what ensures the renders clients see match what actually gets installed, rather than a generic approximation. It's one of the more technically demanding parts of the build, and it's central to making the visualization suite something clients can trust.

Payment Terms

Payment will follow a progress-linked cycle rather than the milestone-percentage structure in the original proposal:

- Rs. 25,000 billed at every 15-day cycle, at minimum, contingent on visible progress in that cycle.
- A closing bonus of Rs. 25,000 on final delivery and sign-off.

This works out to the full engagement value of Rs. 2,00,000 across the build. If progress in a given 15-day cycle falls materially short, that cycle's billing will be discussed and adjusted accordingly rather than charged automatically.

Milestone	Timeframe
Work begins	On first payment cycle
Development & R&D phase	~2 Months
Complete product development & refinement	~ 3 Months

Rough Timeline

The project will be developed progressively, including R&D, AI/model experimentation, fine-tuning, integrations, testing, and frontend refinement. The **overall estimated timeline is approximately 3 months**, with feature sequencing adjusted based on technical requirements and dependencies.
